

Alco Controls

D A T A S H E E T

Adjustable temperature controls for refrigeration applications.

Features

- Housing variants for top and front operation
- · Flush mounted version
- · Adjustable temperatures and differentials
- · Range and differential pointer in units °C and °F
- · Range and differential individually lockable by wire seal
- · High rated SPDT contacts for all versions
- Captive terminal and cover screws
- · Manual toggle for system checkout and override
- Vapour and x-ambient charges
- Sensor shapes for various applications
- Bellows heater for thermostats with vapour charge (not for frost monitors)
- · Room thermostats with insulation console
- · Versions with and without manual override

Options

- Gold plated contacts for electronic applications (PLC, low voltage/current)
- · Factory set to customer specification
- · Different types of mounting brackets
- · Sensor bulb wells and capillary tube holders
- · Special approvals

Introduction

The TS1 Series is ALCO's range of adjustable thermostats for application in refrigeration and heat pump systems.

In these systems, thermostats serve control and monitoring functions, such as space temperature control, high/low temperature alarming or defrost termination. By operating a set of electrical contacts, a temperature value is kept inside a certain limit.

Several housing variants and sensors are provided in order to suit a control to a specific application.

Housing variants

TS1 controls can be delivered in three main housing variants, top operated, front operated and flush mounted.

Top operated controls have adjustment spindles at the top and a display scale, indicating temperature setpoint and differential, at the front. A knob which may be permanently plugged onto one of the adjustment spindles comes with every control. Frost monitors and room thermostats are derivatives of top operated thermostats. They differ by their sensors and other features to suit their particular target applications.

Front operated controls have an adjustment knob at the front for the temperature setpoint with an approximate scale imprinted on

TS1 FrontOperated

TS1 Flush Mounted

the knob. In order to adjust the temperature differential, the cover of the control must be removed.

Flush mounted controls are designed in a way that they can be integrated into a panel or housing, for example into display cases.

All of these three variants are available either with or without off-switch, which cuts off power supply to the thermostat in off position

Temperature sensing

TS1 thermostats sense temperature by means of a thermal system, consisting of temperature charge, bulb, capillary and bellows. The temperature charge changes its pressure based on the refrigerant temperature to be sensed. The sensor is the portion of the system which is in thermal contact with the refrigerant, the capillary connects the sensor with the bellows and the bellows contracts or expands depending on the temperature, causing the thermostat to operate the electrical contacts. An exception are capillary type of sensors, which do not have a bulb, instead, their capillary serves as the bulb directly.

Alco Controls

DATA SHEET

Charges and sensor types are matched to temperature ranges and other application specific characteristics. TS1 thermostats come with two charge types: vapour and adsorption charges. The application temperature range covered by each charge type is shown below:

Vapour charge - Sensor type A, E, P

These sensing elements always sense from the coldest point on the capillary, coil, bulb or power element head. For proper operation it must be ensured that this coldest point is at the sensor portion which is exposed to the medium tempereature to be sensed. The sensing location should be at least 2K colder than the other parts of the thermal system.

In order to avoid unwanted effects of heat transfer, e.g. from a cold wall, ALCO vapour charged thermostats come with an integrated bellows heater (not for frost monitors), which is rated for 230V applications. For other applications the heater must be disabled, alternatively, a bellows heater with a different rating may be available.

In addition to the bellows heater, room thermostats are supplied with an insulation console for the same reason.

Sensor type 'A' is a coiled bulb sensor with two meter capillary, which may be used with or without a bulb well. Style 'E' is a coil sensor for space temperature sensing, and type 'P' is a capillary type of sensor which can be wrapped around a heat heat exchanger's surface in order to sense the coldest point on the heat exchanger for frost protection applications.

Vapour charges respond faster to temperature changes than adsorption and liquid charges.

Adsorption charge - sensor type F

Adsorption charged sensor types operate on the basis of a temperature dependent adsorption material, which is located inside the bulb only. Therefore these sensor types always respond to temperature changes at the bulb only. This makes them suitable to applications where it is not always defined which part of the thermal system the coldest point is (cross ambient applications). An example for such applications is defrost control.

Adsorption charges are slower in response to temperature changes than vapour charges.

Setpoints

TS1 are adjustable controls with adjustment spindles for range and differential*. By turning the range spindle, the *upper setpoint* is defined and by adjusting the differential spindle, the differential and hence the *lower setpoint* is defined.

The dependency between upper and lower setpoint is always as follows:

lower setpoint = upper setpoint - differential

The following two rules should be kept in mind:

- an adjustment of the range spindle always affects both, upper <u>and</u> lower setpoint.
- an adjustment of the differential spindle affects the lower setpoint, only.

The following diagrammes depict this dependency:

Effect of turning range spindle

Effect of turning differential spindle

The controls are equipped with display scale and pointers to indicate the approximate settings. Top operated controls have display scales in units °C and °F, front operated controls have a display scale in units °C.

For precise setting of the controls, external thermometers must be used.

*) Manual reset controls and some other controls have a fixed differential and no differential spindle

Alco Controls

D A T A S H E E T

Electrical contacts

TS1 temperature controls are equipped with high rated double snap action contacts for shatter-free and reliable operation.

All contacts throughout this range of controls are designed as Single Pole Double Throw (SPDT) contacts. One contact may be used for control and the other contact for alarm/status indication or auxilliary control.

Gold plated contacts are available on request for low electrical loads, for example in electronic signalling applications.

For applications using a supply voltage other than 230V and for applications using gold plated contacts, the bellows heater of vapour charged thermostats (sensor style A, E or P - not for frost monitors function C or D) must be disabled.

Contact function

Thermostat contacts TS1 are labelled 1-2-4 where '1' refers to the common pole, '2' refers to the lower setpoint and '4' refers to the upper setpoint.

The contact function for automatic and manual reset versions is as described below.

Automatic reset

On temperature rise above the upper setpoint, contacts 1-2 open and contacts 1-4 close. On decreasing temperature lower setpoint contacts 1-4 open and contacts 1-2 close.

Automatic reset contact function

Manual reset low temperature

On decreasing temperature below the lower setpoint, contacts 1-4 open, contacts 1-2 close and latch. Only on pressure rise above upper setpoint <u>and</u> after pressing the manual reset button contacts 1-2 will open and contacts 1-4 will close again.

Manual reset low pressure contact function

Manual reset high temperature

On increasing temperature above the upper setpoint, contacts 1-2 open, contacts 1-4 close and latch. Only on falling temperature below lower setpoint <u>and</u> after pressing the manual reset button, contacts 1-4 will open and contacts 1-2 will close again.

Manual reset high temperature contact function

For operational safety, all TS1 with manual reset are designed as *trip-free* controls, i.e. pressing the manual reset button while the temperature has not reached its reset treshold will not operate the electrical contacts.

Off-switch

TS1-B/F/H with an off-switch (TS1-B/F/H) cut off the line to terminal 1 when in Position "STOP".

Off-switch interrupting line to terminal 1

Bellows heater

TS1 with vapour charges, ie. sensor types A, E, P (not frost monitors function C or D) have a bellows heater wired across the contacts in the following way.

Bellows heater

Installation and maintenance

Controls come with an adjustment knob and a lockplate which may be used to protect the settings by wire-seal if desired. Range and differential spindle may be sealed independent from each other.

A front access manual toggle is provided for checking out control operation. All TS1 controls come with heavy duty terminal blocks which are finger-proof and feature wire clamps plus non-loosable terminal screws for ease of wiring.

Available accessories include mounting brackets of various types, sensor bulb wells and capillary tube holders.

The standard mounting holes for mounting brackets are equipped with a universal thread to fit both, M4 and UNC 8-32 screws. The standard wholesale package includes two mounting screws.

In addition, further hole patterns for surface mounting are provided.

Alco Controls

Nomenclature

The following chart explains the nomenclature of the TS1 controls for ease of reference. The basic structure is that of a three digit Product Name followed by a three digit code, describing Function, Temperature Range and Temperature Sensor.

Customised versions, which deviate from standard catalogue products are available on request and use a different Product Name. They are called TSA followed by the three digit code to indicate function, temperature range and temperature sensor.

Alco Controls

D A T A S H E E T

Accessories

ALCO CONTROLS is not to be held responsible for erroneous literature regarding capacities, dimensions, applications, etc. stated herein. Products, specifications and data in this literature are subject to change without notice. The information given herein is based on technical data and tests which ALCO CONTROLS believes to be reliable and which are in compliance with technical knowledge of today. It is intended only for use by persons having the appropriate technical knowledge and

skills, at their own discretion and risk. Our products are designed and adapted for fixed locations. For mobile applications failures may occur. The suitability for this has to be assured from the plant manufacturer which may include making appropriate tests. Since conditions of use are outside of ALCO'S control we can not assume any liability for results obtained or damages occurred due to improper application. This document replaces all earlier versions.
